Physiol, Moscow Tech Inst of Fish Ind im A. I.  
Mikoyan

Fiziol Zhur SSSR, No 4, Vol 38, pp 490-495

Human leucocytes as well as in those of cold-blooded animals show no phagocytosis at 0°C and below. Phagocytosis starts only at a temp slightly above zero. In human leucocytes and those of cold-blooded animals it increases with the increase of temp and reaches its highest point at 37°C in man and 30°C in frogs. In expts the const which

27339

characterizes the change in reaction rate (Arrhenius constant) was found to be approx the same in man and frogs. The temp coef of phagocytosis  $Q_{10}$  for man equaled 2.6 between 20°C and 30°C and 1.7 bet 30°C and 37°C.  $Q_{10}$  reaches a max in cold-blooded animals at temps of 5-10°C, decreasing above this temp. The ability of human leucocytes to adhere to solid substances does not parallel the speed of phagocytosis. Received 6 Feb 49.

CR

Homologs of damascenine alkaloid. V. M. Rudakov and A. M. Kabanov. *Dokl. Akad. Nauk S.S.S.R.*, 1937, 101, 811. (Chem. Abstr. 1937, 31, 1101.) cf. Rudakov, Kanevskaya and Kupinskaya, *ibid.* 1937, 101, 1101. Kabanov (C. A. 6, 2037) has shown that damascenine of *Nigella damascena* is 2,3-MeNH(MeO)C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>Me. It was of interest to compare the physico-chemical action of the homologous Me 2-N-methylamino-2,4- (I) and Me 6-N-methylamino-2,4-dimethoxybenzoic acids (II) with that of damascenine. I and II were prepd. from the previously obtained corresponding acids, 2,3,4-tri-N(MeO)C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H (III), m. 180-2°, on refluxing with MeOH and H<sub>2</sub>SO<sub>4</sub> gave 82.5% of the Me ester, m. 68-70°. This (3 g.) with 6 cc. MeOH and 1 cc. MeI in a sealed tube heated at 110° for 3 hrs. gave 47% I, m. 110-12°. I can be prepd. in 60-70% yield from 31 g. of Me ester and 10 g. p-MeC<sub>6</sub>H<sub>4</sub>SO<sub>2</sub>Me (IV) at 100° for 1.5 hrs. 6-Amino-2,4-dimethoxybenzoic acid, m. 90-8°, treated as above with MeOH and H<sub>2</sub>SO<sub>4</sub> resulted in only 2% of Me ester. It is better methylated by way of the benzylidene deriv., HOOC(MeO)C<sub>6</sub>H<sub>3</sub>N·CHPh, m. 148-50°, prepd. in 70% yield from 3.5 g. of the acid in 15 cc. alc. and 3 cc. BzH<sub>2</sub>. III under ordinary conditions does not form the corresponding benzylidene deriv. Refluxing 25 g. of the benzylidene compd. in 150 cc. MeOH with 50 g. H<sub>2</sub>SO<sub>4</sub> for 5 hrs. resulted in 33.5% of the Me ester, m. 40-51°. This with IV gave about 80% II, m. 61-2°. Chas. Blanc

COMMON ELEMENTS										PROCESSES AND PROPERTIES INDEX										COMMON MATERIALS INDEX									
<p><b>CA</b></p> <p>The reaction of dimethylamine with oplanic acid. V. M. Rodionov and A. M. Fedanova. <i>Bull. acad. sci. U. R. S. S. Classe sci. nat., Ser. chim.</i> 1938, 951-8 (in French, 958-9); cf. C. A. 33, 2032. When oplanic acid is boiled for 5 hrs. with PhNMe<sub>2</sub>, it reacts partly as an aldehyde and gives 32% α-Me oplanate (I), which is best prep'd. by this method. A slight amt. of demethylation also occurs and 3-3.5% isovanillin is formed. However, most of the acid reacts in the hydroxyphthalide form and gives 37.5% dimethylaminophenylisocoumarin (II), m. 136-6°; HCl salt, m. 116-7°. Some demethylation also occurs and gives 18.5% dimethylaminophenylisocoumarin, m. 183-4° (isolated as the insol. Na salt). This comp'd. can be methylated to give III and silylated to give dimethylaminophenylisocoumarin silylate, m. 137-8°. The formation of I is facilitated by the formation of BrOMe when BrOH is boiled with PhNMe<sub>2</sub>, but in this case the yield of ester is only 10%.</p>										<p><b>10</b></p>

## Condensation of dialkylallenes with carboxylic acids.

III. The reaction of dimethyl- and diethylallenes with hydroxybenzoic acids. V. M. Roshinov and A. M. Fedorova. *Bull. Acad. Sci. U. R. S. S. Classe sci. chim.* 1946, 235-8; cf. *C. A.* 43, 2489. —In continuation of their previous work on reactions of dialkylallenes with various aromatic carboxylic acids (loc. cit.), the authors studied the reaction of dimethyl- and diethylallenes with hydroxybenzoic acids. It was found that *o*- and *p*-HO acids yield the corresponding Me or Et esters, i. e. with PhNR<sub>2</sub> acting as an alkylating agent. In the course of the prepn. of *m*-HOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H for this work, it was established that its correct m. p. is 200-1°; the figure of 184°, which is given in both new and old editions of Beilstein, is apparently an old error which has been inadvertently retained and should be corrected. Salicylic acid (100 g.) and PhNMe<sub>2</sub> (200 g.) were refluxed for 4 hrs., cooled, dissolved in HCl and extd. with Et<sub>2</sub>O; the latter, after washing with Na<sub>2</sub>CO<sub>3</sub>, was distd., yielding only PhOH (54 g. re-distd., b. 180-2°); the alk. wash liquor yielded only 0.5 g. salicylic acid. Refluxing a mixt. of 75 g. *p*-HOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H and 150 g. PhNMe<sub>2</sub> for 4 hrs. yielded, on working up as above, 37.5 g. (51%) PhOH. Refluxing a mixt. of 50 g. *m*-HOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H and 100 g. PhNMe<sub>2</sub> for 4.5 hrs., followed by steam distn. to remove unchanged amine, wash. of the residue in Et<sub>2</sub>O and washing the latter with Na<sub>2</sub>CO<sub>3</sub>, yielded 40 g. pure *m*-HOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H (from the alk. ext.) and 10.75 g. *Me m*-hydroxybenzoate, m. 60-70° (from benzene), which represents a 97.7% yield of the ester based on reacting acid. The same reaction with 100 g. PhNEt<sub>2</sub> (heating for 4 hrs.) yielded 24 g. unchanged acid and 20.7 g. (93%) *Et m*-hydroxybenzoate, m. 73-3°. Refluxing a mixt. of

30 g. *m*-MeOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H with 20 cc. PhNMe<sub>2</sub> yielded 24 g. unchanged acid and 2.5 g. (98%) *Me m*-methoxybenzoate, as a viscous oil. 2,3-HO(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H (40 g.) and 150 cc. PhNMe<sub>2</sub> were heated for 4 hrs. yielding 20 g. (98.1%) crude guaiacol (24.3 g. pure *o*-MeOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H). The 2,3-HO(MeO)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H was prepd. as follows: guaiacol was mixed with a triple amt. of well-heated K<sub>2</sub>CO<sub>3</sub> and heated at 170-80° under slight vacuum, cooled, treated with CO<sub>2</sub> at 2-2.5 atm. pressure and slowly heated to 180° with 0-8 atm. total pressure; the mixt. was dissolved in water, filtered and acidified by HCl, yielding the crude acid, which was recrystd. from water, from which it crystallizes with 1 mol. H<sub>2</sub>O, m. 150-2°; yield 65.5%. IV. Reaction of dimethyl- and diethylallenes with acrylic acids. *Ibid.* 239-43. —In continuation of the above-reported work, the authors studied the reaction between dimethyl- and diethylallenes with cinnamic acid (I), 3,4-dimethoxycinnamic acid (II), 3,4-methylenedioxybenzoic acid (III) and methoxycinnamic acid (IV). I (50 g.) and 100 g. PhNMe<sub>2</sub> heated for 4 hrs. at reflux yielded 44 g. unchanged acid, and 3 g. of a mixt. of styrene and *Me* cinnamate (about 1 g. styrene actually isolated). II (dimethylcinnamic acid) (5 g.) and 20 cc. PhNMe<sub>2</sub> treated as above gave an almost quant. recovery of the unchanged acid. III (25 g.) and 150 cc. PhNMe<sub>2</sub> were refluxed for 4 hrs., extd. with Et<sub>2</sub>O and filtered, yielding 10.3 g. (41%) unchanged acid; 9.1 g. more was obtained on washing the Et<sub>2</sub>O ext. with Na<sub>2</sub>CO<sub>3</sub> and acidification. The Et<sub>2</sub>O ext. gave 1.3 g. (30%) *Me* ester of III, m. 65-6°. IV (50 g.) and PhNMe<sub>2</sub> (quantity not stated) were refluxed for 4-5 hrs.; PhNMe<sub>2</sub> was removed by steam distn. and the

residue which crystd. on standing was filtered after treatment with  $\text{Et}_2\text{O}$  and  $\text{Na}_2\text{CO}_3$  soln. The filtered solid was the Me ester (V) of IV, m.  $122-3^\circ$  from  $\text{EtOH}$  (10.5 g. or 20%). On acidification of the alk. ext. there was obtained 3.5 g. of a solid, m.  $225-6^\circ$ , which had (by titration) a mol. wt. of 150, and corresponded to  $4,5\text{-MeO(110)C}_7\text{H}_6\text{O}_2$ , but was not the known hesperetin, which m.  $250-7^\circ$ . The filtrate after isolation of this material yielded about 1 g. IV. The  $\text{Et}_2\text{O}$  soln. after removal of V was washed with  $\text{Na}_2\text{CO}_3$ , and acidification of the latter yielded 18.8 g. methylmethoxy and 5.3 g. hesperetin on acidification by  $\text{HCl}$ ; the 2 were sepd. by soln. of the mixt. in  $\text{Et}_2\text{O}$  and shaken with dil.  $\text{NaOH}$ , which left only methylmethoxy in the  $\text{Et}_2\text{O}$  layer. Similar reaction of 50 g. IV with  $\text{Ph-NH}_2$  yielded 7 g. V, 4 g.  $\text{Me ester}$  of IV, m.  $80-1^\circ$ , about 20 g. hesperetin, and 1 g.  $\text{Me ester}$ . There was no evidence of formation of methylmethoxy, indicating that in this case the initial decarboxylation does not take place and that a deep-seated breakdown of the mol. occurs immediately with formation of hesperetin and its polymers. The formation of the Me ester is probably due to the action of  $\text{MeOH}$  formed on demethylation of 1 of the 2 MeO groups of IV. G. M. Komolapoff

Structure of 1-naphthaldehyde-8-carboxylic acid. V. M. Rodinov and A. M. Fedarova (Acad. Sci. U.S.S.R., Moscow). *Izv. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1950, 247-52. -- 1-Naphthaldehyde-8-carboxylic acid (I) reacts with malonic acid,  $\text{Me}_2\text{NPh}$ , and  $\text{Ac}_2\text{O}$  ex-

clusively in the cyclic form,  $\text{C}_{10}\text{H}_6\text{CH}(\text{OH})\text{O}\cdot\text{CO}$ , thus indicating that I exists largely in this form in the tautomeric system with the normal open structure. Acenaphthene (80 g.) in 350 ml.  $\text{AcOH}$  treated at 95-100° with 225 g.  $\text{Na}_2\text{Cr}_2\text{O}_7$  at once (vigorous reaction), then with  $\text{H}_2\text{O}$ , filtered, extd. with hot 10%  $\text{Na}_2\text{CO}_3$ , and acidified, gave 16 g. naphthalic acid, m. 280°; the alkali-insol. ppt. boiled with 300 ml. 30%  $\text{NaHSO}_4$ , dild. with 400 ml.  $\text{H}_2\text{O}$ , boiled, filtered, and the insol. residue retreated as above, gave a filtrate which on acidification with  $\text{H}_2\text{SO}_4$  gave 30.5% acenaphthenequinone, m. 259-60°. This (25 g.) heated 1 hr. with 125 ml. 30%  $\text{KOH}$  up to 140°, treated with 100 ml.  $\text{H}_2\text{O}$ , kept 1 hr. at 140-50°, extd. with  $\text{H}_2\text{O}$ , and acidified to Congo red gave 60% I, m. 166-8°. Attempted condensation of I with malonic acid in the presence of  $\text{HIOH}\cdot\text{NH}_3$  failed. However, 20 g. I and 100 ml.  $\text{Me}_2\text{NPh}$  refluxed 4-5 hrs., made alk., steam-distd., treated with  $\text{HCl}$  to remove unchanged I (5.2 g.), and the alkali-insol. ppt. extd. with mineral acid ( $\text{HCl}$ ) gave 2 g. condensation product, m. 135-7°,

probably 1,8- $\text{C}_{10}\text{H}_6\text{CH}(\text{C}_6\text{H}_4\text{NMe}_2)\text{O}\cdot\text{CO}$ ; the acid-insol. material (10.7 g.) was naphthalic anhydride, m. 240°. Similar refluxing of acenaphthenequinone with

$\text{Me}_2\text{NPh}$  gave 85% yellow 1,8- $\text{C}_{10}\text{H}_6\text{C}(\text{C}_6\text{H}_4\text{NMe}_2)_2\text{CO}$ , m. 201-2° (from  $\text{C}_6\text{H}_6$ ). Boiling 10 g. acenaphthenequinone, 5.8 g. malonic acid, and 40 ml. 5.5% alc.  $\text{NH}_3$  4-5 hrs. and treating with  $\text{Na}_2\text{CO}_3$  gave 4.5 g. alkali-sol.

1,8- $\text{C}_{10}\text{H}_6\text{C}(\text{CHCO}_2\text{H})_2\text{CO}$ , m. 186°, 2.5 g. acenaphthenequinone, and 6 g. 1,8- $\text{C}_{10}\text{H}_6\text{C}(\text{NH}_2\text{HCO})(\text{CHCO}_2\text{H})_2\text{CO}$ , m. 227-9° (from  $\text{EtOH}$ ). Slow distn. of 25 g.  $\text{NH}_3$  carbonate, 110 ml.  $\text{AcOH}$ , and 25 g. naphthalic acid yielded 98% naphthalimide, m. 300° (from  $\text{EtOH}$ ), after the usual washing with  $\text{H}_2\text{O}$ ,  $\text{Na}_2\text{CO}_3$ , and  $\text{H}_2\text{O}$ .

Organic Chem.

Ch. ry of pyrazolone derivatives. V. M. Rodionov and A. Ya. Fedorova. *Izvest. Akad. Nauk S.S.S.R., Otdel. Khim. Nauk* 1953, 1041-50. To 200 ml.  $\text{Na}_2\text{SO}_3$  prepri. from 60 ml. 36%  $\text{NaHSO}_4$  and 150 ml. 6%  $\text{NaOH}$ , was added 24.9 g. *N*-methoxycarbonyl-*p*-aminobenzenesulfonyl chloride (I); after shaking 2 hrs. with addn. of  $\text{NaOH}$  to maintain alkalinity the filtrate was acidified with 60%  $\text{H}_2\text{SO}_4$  yielding 83.7%  $p\text{-MeO}_2\text{CHNC}_6\text{H}_4\text{SO}_3\text{H}$ , m. 142-6° (from  $\text{H}_2\text{O}$ ). This (16 g.) in 148 ml. warm 2.5%  $\text{Na}_2\text{CO}_3$  treated with 11.8 g.  $\text{AgNO}_3$  in  $\text{H}_2\text{O}$  gave 71.5%  $\text{Ag}$  salt, which refluxed 2 hrs. on steam bath with  $\text{MeI}$  gave 66% *Me* ester, m. 182-3°; the same forms in 53% yield through the *K* salt and  $\text{MeI}$  in  $\text{MeOH}$ ; the *K* salt is obtained by evapn. of soln. of the acid in  $\text{K}_2\text{CO}_3$  soln. I (48 g.) in 200 ml.  $\text{MeOH}$  treated with  $\text{MeONa}$ , from 5 g.  $\text{Na}$  and 150 ml.  $\text{MeOH}$ , under 10° gave  $p\text{-MeO}_2\text{CHNC}_6\text{H}_4\text{SO}_3\text{Me}$ , 80.5%, m. 115-16° (from  $\text{MeOH}$ ); if  $\text{NaOH}$  is used in place of  $\text{MeONa}$  the yield drops to 60-6%. The ester (4.5 g.) and 3.5 g. 1-phenyl-3-methyl-2-pyrazolin-5-one heated 30 min. at 160°, dild. in  $\text{H}_2\text{O}$  and extd. with  $\text{Et}_2\text{O}$  gave on evapn. of

the aq. layer, extn. with  $\text{EtOH}$  and addn. of  $\text{Et}_2\text{O}$  the crude adduct, m. 58-60°, 1-phenyl-2,3-dimethyl-5-oxo-2-pyrazolinium *p*-*N*-methoxycarbonylamino benzenesulfonate. I (25 g.) in 250 ml.  $\text{Et}_2\text{O}$  treated with 100 g.  $\text{NaHCO}_3$  followed by 5 g.  $\text{NH}_2\text{NH}_2$  in 45 ml.  $\text{EtOH}$  with cooling, gave 81%  $p\text{-MeO}_2\text{CHNC}_6\text{H}_4\text{SO}_3\text{NHNH}_2$ , m. 170-3° (crude), m. 181-3° (decompn., from  $\text{EtOH}$ ). This (4.9 g.) and 3 ml.  $\text{AcCH}_2\text{CO}_2\text{Et}$  in 30 ml.  $\text{EtOH}$  refluxed 1 hr., concd. and cooled, gave 80.5% *p*-methoxycarbonylamino phenyl 3-methyl-5-oxo-2-pyrazolin-1-yl sulfone, m. 156-8° (from  $\text{EtOH}$ ). If the reaction is run with azeotropic removal of  $\text{H}_2\text{O}$  in boiling  $\text{MePh}$  the yield is 90% and product, m. 158-60°. The above hydrazide refluxed 1 hr. with  $\text{BzH}$  in  $\text{EtOH}$ , gave 64.7%  $p\text{-MeO}_2\text{CHNC}_6\text{H}_4\text{SO}_3\text{NHN:CHPh}$ , m. 198-201°. Similar reaction with  $\text{Me}_2\text{CO}$  in  $\text{AcOH}$  gave 43%  $p\text{-MeO}_2\text{CHNC}_6\text{H}_4\text{SO}_3\text{NHN:CMc}$ , m. 200-2° (from  $\text{EtOH}$ ). Treatment of  $p\text{-AcNHCC}_6\text{H}_4\text{SO}_3\text{Cl}$  with  $\text{NH}_2\text{NH}_2\cdot\text{H}_2\text{O}$  in  $\text{Et}_2\text{O}\text{-MeOH}$  5 hrs. in presence of  $\text{NaHCO}_3$ , as above, gave 105.5%  $p\text{-AcNHCC}_6\text{H}_4\text{SO}_3\text{NHNH}_2$ , which (3 g.) refluxed with 1.7 ml.  $\text{AcCH}_2\text{CO}_2\text{Et}$  in dry  $\text{C}_6\text{H}_6$ , with continuous removal of  $\text{H}_2\text{O}$  as azeotrope, gave 69%  $p\text{-AcNHCC}_6\text{H}_4\text{SO}_3\text{NHN:CH}_2\text{CH}_2\text{CO}_2\text{Et}$  (II), m. 118-20° (from  $\text{EtOH}$ ). To 65 g.  $\text{AcCH}_2\text{CO}_2\text{Et}$  in 130 ml.  $\text{H}_2\text{O}$  was gradually added 27 ml.  $\text{NH}_2\text{NH}_2\cdot\text{H}_2\text{O}$  in 135 ml.  $\text{H}_2\text{O}$ , then heated 0.5 hr. On cooling there was formed 77.5% 3-methyl-2-pyrazolin-5-one, m. 210-13°. Heating this with equimolar amount of  $p\text{-AcNHCC}_6\text{H}_4\text{SO}_3\text{Cl}$  in  $\text{C}_6\text{H}_6\text{N}$  gave 30% *p*-acetylamino phenyl 3-methyl-5-oxo-2-pyrazolin-1-yl sulfone; in  $\text{Me}_2\text{CO}$  the yield is 42%. For best result 7.85 g. 3-methyl-2-pyrazolin-5-one, 18.6 g.  $p\text{-AcNHCC}_6\text{H}_4\text{SO}_3\text{Cl}$ , 8 g.  $\text{NaOAc}$  and 100 ml.  $\text{AcOH}$  were refluxed 2 hrs., dild. with 200 ml.  $\text{H}_2\text{O}$  and filtered, yielding 64.2% product, crystals (from 50%  $\text{EtOH}$ ). Attempts to deacetylate this material with dild.  $\text{HCl}$  showed that even at 75° decompn. takes place. However, refluxing 3 g. of the compd. with 3 ml. 35%  $\text{HCl}$  in 30 ml.  $\text{Me}_2\text{CO}$  1 hr., followed by concn. and treatment with  $\text{NH}_4\text{OH}$  and extn. with  $\text{CHCl}_3$  gave 74% free amino analog, m. 152-5° (from aq.  $\text{EtOH}$ ). Attempts to close the ring in II by heating under various conditions gave either no reaction or yielded noncrystallizable oils and tars. O. M. Kosolapoff

TITLE: Correlation between temperature and pressure in the free atmosphere over the northern hemisphere

SOURCE: Moscow. Nauchno-issledovatel'skiy institut aeroklimatologii. Trudy, no. 30, 1965. O korrelyatsionnykh zavisimostyakh temperatury i davleniya v svobodnoy atmosfere (Correlations of temperature and pressure in the free atmosphere), 92-101

TOPIC TAGS: free atmosphere, atmospheric pressure, atmospheric temperature, troposphere, stratosphere

ABSTRACT: To gain insight into the crosscorrelation between temperature and pressure in the troposphere and in the stratosphere, crosscorrelation coefficients between temperature and pressure were computed at the whole range of available altitude level data, from station ground level, to 25 - 28 km heights. The results are presented in form of graphs depicting isocorrelate lines (lines of equal crosscorrelation coefficients) as functions of temperature at a given height  $H_1$  (abscissa), and pressure at a desired pressure-correlating height  $H_2$  (ordinate). Graphs are presented for three representative latitude groups: Keflavik - northern; Rome - moderate and Aden - tropical. The basic relationships are clearly depicted in these graphs. All stations show zones

of high positive correlation coefficients in the troposphere (e.g. between temperature at 6km and pressure at 12 km for Rome, summer); there is a zero crossing zone and negative correlation for 10 km temperatures and all other pressures; there is a zone of high negative correlation; and a zone of substantial correlation in the stratosphere. Correlation coefficients between temperature and pressure at the same height are located in the graph on a 45 degree line. The isocorrelate graphs are similar for the northern and the moderate latitudes, but quite different for the tropical latitudes. This can be seen by comparing the graphs shown in Fig. 1 (Rome) and Fig. 2 (Aden). The authors discuss these and other features of the hemispheric crosscorrelation picture in detail, with the additional consideration of the influence of seasons. They also note that the crosscorrelation coefficients between temperature and pressure at equal altitudes never attain the high values found for the correlation of certain lower altitude temperatures with higher altitude pressures. In these latter cases crosscorrelation coefficients as high as .8 - .9 occur. Thus the temperatures appear to be more significantly related to higher and lower altitude pressures than to pressures at their own levels. Orig. art. has 4 figures.

TITLE: A digital device for recording information from frequency meters. Class 42,  
No. 151888  
SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 23, 1966,  
187-188  
TOPIC TAGS: digital system, frequency meter  
ABSTRACT: This Author's Certificate introduces a digital device for recording in-  
formation from frequency meters. The unit contains a standard frequency pulse gene-  
rator, a counter-divider, an output counter and a system of valves. The unit is de-  
signed for using a loop or electronic oscillograph as the code registration instrument.  
The output of the frequency meter is connected to the input of a counter-distributor  
which controls a commutator used for sequential connection of the loop (beam) of the  
oscillograph to all digits of the output counter.

Abstract: blood of the carotid artery and in the lymph of the thoracic duct. The content of histamine in the blood and lymph gradually increased, and reached a maximum in three days (260 and 182 percent respectively). In ten days, the concentration of histamine in the blood was higher than in the lymph (117 and 80 percent). The content of histamine in the blood and lymph changes at almost the same rate, and reaches a maximum in three hours (201 percent in the blood and 164 percent in the lymph). During the following days the activity of the histaminase decreased; yet it remained somewhat higher than normal. The activity of the cholinesterase decreased in the blood and lymph, especially after two to three days (49 and 50 percent of the original figure). -- I. A. Oyvin

TITLE: Addition of methyl dichlorosilane to allene hydrocarbons

PERIODICAL: Akademiya nauk SSSR. Doklady, v. 145, no. 4, 1962, 837 - 840

TEXT: The addition of methyl dichlorosilane to propyl and butyl allenes as well as to methyl propyl and methyl amyl allenes in the presence of  $H_2PtCl_6$  was investigated. The monoadducts were subjected to JR-spectral and ozonolytical analysis and to hydration. The effect of adding methyl dichlorosilane to olefins depends evidently on a nucleophilic mechanism whereby, firstly, the hydride ion attaches itself to the central atom of the allene system. Since the direction of addition is determined sterically, a 1,2-addition takes place in the case of monosubstituted allenes, but addition on the small radical in the case of disubstituted allenes. The properties of all monoadducts are listed (Table 2). There are 1 figure and 2 tables.

TITLE: The FEU-56 photomultiplier tube /Report, Thirteenth Annual Conference on Nuclear Spectroscopy held in Kiev 25 Jan to 2 Feb 1963/

SOURCE: AN SSSR. Izvestiya. Seriya fizicheskaya, v.28, no.2, 1964, 384-387

TOPIC TAGS: photomultiplier, photomultiplier characteristics, photomultiplier parameters, FEU-56, photomultiplier

ABSTRACT: The paper gives a description of the new Soviet photomultiplier designated the FEU-56 and the results of comparative measurements of the performance of this tube. The FEU-56 has an 80 mm diameter front window and an overall length of 125 mm. In general design it is similar to the FEU-52, and as in the case of the latter tube all the leads are brought out through the base (no side leads). In contrast to the FEU-52, however, the FEU-56 has an antimony-caesium photocathode on a transparent conducting backing. The basic parameters of the FEU-56 are listed in a table; it has 12 multiplication stages, its spectral sensitivity range extends from 3000 to 6500 Å with the peak at about 4000 Å. The operating characteristics are shown in curves

Card 1/2

ACCESSION NR: AP4024064

and compared with those of the FEU-24 and FEU-32. The amplitude resolution of the FEU-56 with an NaI crystal is 10-12%; the base pulse width is about 50 nanosec, the pulse rise time about 8 nanosec. The tests showed that the FEU-56 can operate satisfactorily under the conditions of a strong  $\gamma$ -background. Orig.art.has: 6 figures and 3 tables.

TITLE: Preliminary results of testing an ageostrophic method for precomputing the fields of wind, temperature and vertical currents

SOURCE: Leningrad. Glavnaya geofizicheskaya observatoriya. Trudy\*, no. 143, 1963  
Voprosy\* chislennogo prognoza i struktura meteorologicheskikh poley (Problems in numerical forecasting and structure of meteorological fields) 3-13

TOPIC TAGS: meteorology, wind, air temperature, atmospheric vertical currents, ageostrophic model, atmospheric pressure field, baroclinic model.

ABSTRACT: A report has been published giving the preliminary results of testing the method for precomputing the fields of wind, temperature and vertical currents in the atmosphere, using an ageostrophic model, originally proposed by Pyatygina (Trudy GGO, No. 121, 1961). Computations were made with a BESM-II computer. The initial data were the components of the geostrophic wind and temperature at 263 points on a European grid. Only three precomputations have thus far been made for 12- and 24-hour periods. The synoptic situation for the three cases is described. The precomputed and actual values for the wind field were compared for

Card 1/5

ACCESSION NR: AT4016867

the 97 inner points of the grid. The method for evaluating statistical errors is discussed. In the prediction of the wind field for 12 hours in advance the results were satisfactory for the 850- and 500-mb levels, with somewhat less error for the lower level. Errors are less than when the inertia method is used, particularly for the 850-mb level. The time interval used was 2 hours. This interval was unsatisfactory for a 24-hour prediction of the wind and temperature fields. Reduction of the interval to 1 hour for the four levels analyzed yielded satisfactory results for the 24-hour forecast for the 850- and 500-mb levels, but considerable error remained for the 300- and 200-mb levels; errors were prominent in the region of jet streams. Fig. 1 in Enclosure shows an example of the temperature forecast. The temperature field was computed on the basis of vertical velocities, which were precomputed successfully. Temperature prediction is more accurate than wind field prediction. Orig. art. has: 1 figure, 2 formulas, 9 tables.

TOPIC TAGS: geostrophic wind, weather forecasting, atmospheric geopotential  
12,44,55

ABSTRACT: The results of 27 daily forecasts of wind and temperature fields for levels of 850, 500, 300 and 200 mb are analyzed. In contrast to earlier works, the temperature and wind fields were predicted using a system in Lagrange variables. The method used is briefly described. A high speed electronic computer was used for making the calculations. The initial data consisted of 333 values of geopotential and 263 temperature readings on each of the four levels studied. Tables are given showing the reliability of forecasts for geostrophic wind velocity and temperature variation. Predictions of wind velocity were much more accurate on the 850 and

Card 1/2

L 01453-66

3

500 mb levels than on the 300 and 200 mb levels. The error was 5.5 m/sec for the 850 mb level, 8.0 m/sec for the 500 mb level, and about 13 m/sec for the other two levels. The absolute error in temperature prediction for the troposphere is 2° on the average. However, for the 200 mb level this error is considerably greater (3.2°). The coefficient of correlation between the actual and predicted temperature changes is highest for the 850 mb level, lowest for the 300 mb level. The data are compared with those of other authors. Orig. art. has: 2 figures, 10 formulas, 8 tables.

AUTHORS: Lyubin, V. M., and Fedorova, G. A.

TITLE: High-voltage photoelectromotive forces in layers of  
antimony triselenide

PERIODICAL: Fizika tverdogo tela, v. 4, no. 8, 1962, 2026-2030

TEXT: The spectral distribution of the photoeffect, its lag and its dependence on light intensity were measured with the same instruments that had been used by B. T. Kolomiyets and V. M. Lyubin (FTT, 1, 740, 1959). Antimony and selenium were fused to  $Sb_2Se_3$  in vacuo and condensed on glass or mica plates with platinum or Aquadag electrodes. The photo-voltage was measured with a tube electrometer of type ЭМУ-3 (EMU-3) or with electrostatic voltmeters of type С-95 (S-95). The photo-emf depends on the temperature  $t$  of the backing during condensation and also on the angle  $\theta$  of incidence of the molecular beam, and reached its highest value at  $\theta = 25-45^\circ$  and  $t \approx 300^\circ C$ . A strong photo-emf can arise only in crystalline samples, and a weak one only in amorphous samples. The photo-emf, which does not arise near an electrode, increases in proportion

Card 1/2

High-voltage photoelectromotive...

S/181/62/004/006/004/041  
B125/B104

to the electrode spacing. The photo-emf produced by frontal illumination with white light may have different signs even if the illuminated samples are produced under equal conditions. The volt-ampere characteristics recorded in light and in the dark are linear up to electric field strengths of  $10^4$  v/cm. Both the rise and the decay times of the photo-emf are  $10^{-4}$  sec at most and have no long-time components. The photo-emf of many samples rises very steeply at first. The photocurrent increases in proportion to the light intensity; the photo-emf, however, tends to saturation, and its sign very often changes when white light is incident through the glass backing. The holes are the predominant carriers. Considerable photovoltage (20-30 v/cm) also occurs in  $\text{Sb}_2\text{S}_3$ ,  $\text{Sb}_2\text{S}_3 \cdot \text{Sb}_2\text{S}_3$  (p-type semiconductors),  $\text{Sb}_2\text{S}_3 \cdot \text{Bi}_2\text{S}_3$ , and  $2 \text{Sb}_2\text{S}_3 \cdot \text{Bi}_2\text{S}_3$  (n-type semiconductors). In the case of frontal illumination, the spectral properties of the photovoltage of high-efficient and low-efficient layers are almost the same (Fig. 4). There are 6 figures. X

TITLE: The Problem of High-voltage Photo-electromotive Forces in Thin Semiconducting Layers

PERIODICAL: Doklady Akademii nauk SSSR, 1960, Vol. 135, No. 4, pp. 833-836

TEXT: The authors present the results of a study of high-voltage photo-emf in layers of CdTe and of some antimony and bismuth halides. The initial material was cadmium telluride which is available as a luminescent powder under the trade-mark "ohisty" ("pure"), or is obtained by melting the necessary portions of Cd and Te. Evaporation on glass or mica was done in a graphite container. In all layers produced by this method, a photo-emf of up to 80 - 100 v/cm was established, and some layers showed values of up to 150 - 180 v/cm at room temperature. The magnitude of the photo-emf was a function of the layer thickness, the temperature of the base, and the manufacturing process. A layer thickness of  $d \approx 1.5\mu$  and a base temperature of about  $300^{\circ}\text{C}$  were found to be most favorable; the resistivity of the layer was  $10^7 - 10^8$  ohm.cm. These investigations showed that CdTe can be

Card 1/2

B019/B077

used in television devices. It was found that the sign of the photo-emf can be different even when using equal manufacturing methods. No change of sign was established when the interval between container and base was kept small during the production. The origin of a high-voltage photo-emf is explained by a photo current which might pass through the layer during evaporation and separate the ionized impurities. Tests did not confirm this theory. In different spectral ranges different signs of photo-emf were found; and test results indicated the existence of sublayers which complicate the explanation of high-voltage photo-emf. Practically the same results were obtained for the photo-emf of binary and ternary layers of antimony and bismuth produced in the same way as the CdTe layers. There are 2 figures, 2 tables, and 8 references: 4 Soviet and 4 US. X

 X RAY SPECTRUM, SELENIUM  
 ABSTRACT: The effect of thallium addition on the photoconductivity of amorphous  
 selenium-arsenic semiconductor films, 0.3—7  $\mu$  thick, has been studied extensively  
 in view of the expected improvement in photoelectric property of Se—As films. The  
 first experimental data of the authors on the Se—As—Tl films were published  
 elsewhere [FTT, 1965]. The films of  $Tl_2Se \cdot 10As_2Se_3$ ;  $Tl_2Se \cdot 2As_2Se_3$ ;  $Tl_2Se \cdot As_2Se_3$ ;  
 $2Tl_2Se \cdot As_2Se_3$ ; and  $3Tl_2Se \cdot As_2Se_3$  were deposited on various substrates by vacuum  
 vaporization. The  $Tl_2Se \cdot As_2Se_3$  films were found to be the most promising in applica-  
 tion in the x-ray spectral region and displayed greater photoeffect than the best  
 thallium-free films in the visible spectral region. Radiosensitivity of the

0  
 $Tl_2Se \cdot As_2Se_3$  films versus thickness and preparation technique, x-ray dosimetric and volt-ampere characteristics, kinetics and spectral distribution in the 0.5—1.5 Å range of x-ray conductivity of the films were determined, as well as the quantum yield of the photoconductive effect and the energy of formation of a single electron-hole pair. A vidicon-type camera tube, photoconductive in the visible and x-ray spectral regions, was constructed with a  $Tl_2Se \cdot As_2Se_3$  film deposited on a beryllium face plate as a target. The first experiments with such a vidicon tube showed a short rise time (of the order of tenths of a second) of the system and the feasibility of visualization of the x-ray pictures and of measurement of the radiation intensity in different areas of the target. TITLE: Some singularities of the internal photoeffect in layers of the Se-As-Tl system in the visible and x-ray regions of the spectrum

SOURCE: AN SSSR. Doklady, v. 170, no. 5, 1966, 1052-1055

TOPIC TAGS: selenium compound, arsenic compound optic material, thallium containing alloy, internal photoeffect, photoconductivity, x ray effect

ABSTRACT: The authors report the first results of attempts to increase the photoconductivity of Se-As thin semiconducting layers by introducing thallium. The raw material of the Se-As-Tl system was synthesized by fusing selenium, arsenic, and thallium in vacuum, and the investigated films were prepared by evaporation in vacuum by a method close to that described by the authors earlier (FTT v. 4, 401, 1962). The electrodes were tin dioxide and aluminum. The compositions of the layers investigated were  $Tl_2Se \cdot 10As_2Se_3$ ,  $Tl_2Se \cdot 2As_2Se_3$ ,  $Tl_2Se \cdot As_2Se_3$ ,  $2Tl_2Se \cdot As_2Se_3$ , and  $3Tl_2Se \cdot As_2Se_3$ . The layer thickness ranged from 0.5 to 7  $\mu$ . The conductivity and photoconductivity were investigated by a method described in the earlier paper (and in Pribori i tekhnika

Card 1/2

UDC: 537.312.5

ACC NR: AP6034753

eksperimenta, no. 6, 192, 1965). An increase in the thallium concentration reduced the dark resistance and shifted the spectral characteristics of the photoeffect toward the long-wave region. The greatest sensitivity was observed in  $Tl_2Se \cdot As_2Se_3$ . The x-ray sensitivity was practically constant in the range 0.5 - 1.5 Å, and then increased slowly with increasing x-ray wavelength. The photoeffect depends on the polarity of the voltage applied. At negative potential on the tin-dioxide electrode the spectrum has a single maximum near 350 - 370 nm and depends little on the thickness of the layer. For positive potential, maxima appear both at short and long wavelengths (near 600 nm) and shift toward longer wavelength with increasing thickness. The results are interpreted from the point of view of the processes that occur in the regions near the electrodes. The dark current increased faster than linearly with increasing applied voltage, but the photocurrent exhibited rapid saturation. The quantum yield ranged from 800 to 1400 electrons/quantum and the ionization energy required to produce a single electron-hole pair is 5.7 - 10 ev, close in value to that obtained for many photoconductors sensitive to x-radiation. It is concluded that the Se-As-Tl system can serve as an effective photoconductor for both the visible and the x-ray regions. This report was presented by Academician V. V. Voyevodskiy 14 January 1966. Orig. art. has: 3 figures.

Defining the optimal settings of controllers in cascade automatic control systems on a simulating assembly.

Abstract. The authors propose a method for determining the optimal settings of controllers in cascade automatic control systems on a simulating assembly.

Keywords: automatic control systems.

Summary: A simulating assembly was used to determine the optimal settings of controllers in cascade automatic control systems.

<p>The effectiveness of <math>\beta</math>-naphthol rings against <i>Grapholitha pomonella</i>. G. G. Fedorova. <i>Sadovodstvo</i> 1940, No. 2, 27. --Each of the <math>\beta</math>-naphthol rings which were made around apple trees contained 0-10 dead larvae of <i>G. pomonella</i> at one time and a total of 473 dead larvae during the whole period. Insulating layers of clay and thick milk of lime were used to prevent the burning of the trees and of their roots by solar oil which is a component of the <math>\beta</math>-naphthol rings. Trunks of all trees around which the <math>\beta</math>-naphthol rings are made are preliminarily painted with lime. W. R. Henn</p>

**Study of Structures of Metallic Films Obtained on the Surface of Aqueous Solutions of Metallic Salts by the Effect of Regeneration - Cases (original text in Russian), N. N. Butov, N. V. Demenev, A. S. Shor, and G. G. Fedorova; Colloidal Journal (USSR) Sep-Oct '49 (11-5 Bi-Moly); pp 269-288; 12 illus.** 11, No 5

The article proves that the structure of platinum films varies in its thickness and depends upon the period of regeneration. The initial stages of regeneration produce films consisting of separate elementary crystalline particles. Increased periods of regeneration yield thicker films, consisting of complete units. The films obtained in all cases were porous, consisting of units of variable dimensions. It was also found that the units forming the film have an exceptionally developed surface and are formed by the method of coagulation of elementary crystalline particles. The external appearance of the units during long periods of regeneration is similar to porous platinum. The coagulation of the crystal line particles
